CLAIMS IN THE CASE

What is claimed is:

1. (currently amended) A method for clustering data in a virtual environment,

comprising:

determining a cluster of receiving nodes in said virtual environment, wherein each of said

cluster of receiving nodes have associated values for at least one clustering parameter that as a

set satisfies a test;

generating a common data stream based on said at least one clustering parameter; and

generating a common video image stream as said common data stream of an object

associated with said sending node using a new view synthesis technique, wherein said common

<u>video image stream is rendered from a common perspective in said virtual environment that is</u>

associated with said cluster of receiving nodes; and

sending said common data stream from a sending node to said cluster of receiving nodes.

2. (cancelled)

3. (currently amended) The method of Claim 1 2, wherein said common perspective is

calculated from an average of said at least one clustering parameter.

4. (currently amended) The method of Claim 1 2, further comprising:

generating a three-dimensional model of said object to which said new view synthesis

technique is applied to generate said common video image stream.

5. (Original) The method of Claim 1, wherein data streams associated with said cluster

of receiving nodes are substantially similar.

6. (Original) The method of Claim 1, wherein said sending said common data stream

further comprises:

Serial No.: 10/684,033 2 Examiner: Frantz B., Jean

Art Unit: 2154

multicasting said common data stream from said sending node over a communication network to said cluster of receiving nodes to achieve communication network traffic efficiency.

7. (Original) The method of Claim 1, wherein said at least one clustering parameter

comprises a view dependent clustering parameter that defines an associated perspective of a

(Cargaine) and meeting of Carrier and the result of Carrier and the result of Carrier and Carrier and

receiving node within said virtual environment, wherein each of said cluster of receiving nodes is

spatially located in said virtual environment, such that their respective perspectives are similar

resulting in said clustering parameter that is shared.

8. (Original) The method of Claim 1, wherein said at least one clustering parameter

comprises a temporal clustering parameter, wherein each of said cluster of receiving nodes

require substantially the same frame rate, such that their respective data quality requirements are

similar.

9. (Original) The method of Claim 1, wherein said at least one clustering parameter

comprises a spatial clustering parameter, wherein each of said cluster of receiving nodes require

substantially the same resolution parameter value, such that their respective data resolution

requirements are similar.

10. (Original) The method of Claim 9, further comprising:

limiting resolution of said common data stream based on resolution capabilities of display

devices associated with said cluster of receiving nodes.

11. (Original) The method of Claim 9, further comprising:

increasing a resolution parameter value of a receiving node as said sending node becomes

more important to said receiving node in said virtual environment; and

decreasing said resolution parameter value as said sending node becomes less important

to said receiving node in said virtual environment.

12. (Original) The method of Claim 11, further comprising:

Serial No.: 10/684,033 3 Examiner: Frantz B., Jean

Art Unit: 2154

valuing an importance of said sending node based on whether a receiving node is gazing at a representation of said sending node in said virtual environment.

13. (Original) The method of Claim 11, further comprising:

valuing an importance of said sending node based on how close to a center of a monitoring device associated with said receiving node is a representation of said sending node displayed.

14. (Original) The method of Claim 11, further comprising:

valuing an importance of said sending node based on whether said sending node is speaking.

15. (Original) The method of Claim 1, wherein said determining a cluster of receiving nodes further comprises:

dynamically changing said test for determining said cluster of receiving nodes in said virtual environment in response to changing conditions for computational resources in a communication network supporting said virtual environment and said cluster of receiving nodes.

16. (currently amended) A system for clustering data in a virtual environment, comprising:

a clustering module for determining a cluster of receiving nodes in said virtual environment, wherein each of said cluster of receiving nodes have associated values for at least one clustering parameter that as a set satisfies a test;

a data generator for generating a common data stream based on said at least one clustering parameter; and

a common video image stream generator for generating a common video image stream as said common data stream of an object associated with a sending node using a new view synthesis technique, wherein said common video image stream is rendered from a common perspective in said virtual environment that is associated with said cluster of receiving nodes

a transmitter for sending said common data stream from a sending node to said cluster of receiving nodes.

Serial No.: 10/684,033 4 Examiner: Frantz B., Jean Art Unit: 2154

17. (Original) The system of Claim 16, wherein said at least one clustering parameter

comprises a view dependent clustering parameter, wherein each of said cluster of receiving

nodes is spatially located in said virtual environment, such that their respective perspectives are

substantially similar.

18. (Original) The system of Claim 16, wherein said at least one clustering parameter

comprises a temporal clustering parameter, wherein each of said cluster of receiving nodes

require substantially the same frame rate, such that their data quality requirements are

substantially similar.

19. (Original) The system of Claim 18, wherein said frame rate is increased as said

cluster of receiving nodes is located closer to said sending node in said virtual environment.

20. (Original) The system of Claim 16, wherein said at least one clustering parameter

comprises a spatial clustering parameter, wherein each of said cluster of receiving nodes require

substantially the same resolution, such that their respective data quality requirements are

substantially similar.

21. (Original) The system of Claim 20, wherein said resolution is dependent on a value

of importance said sending node is to a receiving node, such that higher values of importance are

associated with higher resolution.

22. (Original) The system of Claim 16, wherein said virtual environment comprises an

N-way virtual collaborative environment.

23-24 (cancelled)

25. (currently amended) A computer readable medium containing executable

instructions which, when executed in a processing system, causes the system to perform the steps

for clustering data in a virtual environment, comprising:

Serial No.: 10/684,033

5 Examiner: Frantz B., Jean

Art Unit: 2154

determining a cluster of receiving nodes in said virtual environment, wherein each of said cluster of receiving nodes have associated values for at least one clustering parameter that as a set satisfies a test;

generating a common data stream based on said at least one clustering parameter; and generating a common video image stream as said common data stream of an object associated with said sending node using a new view synthesis technique, wherein said common video image stream is rendered from a common perspective in said virtual environment that is associated with said cluster of receiving nodes; and

sending said common data stream from a sending node to said cluster of receiving nodes.

26. (cancelled)

- 27. (currently amended) The computer readable medium of Claim 25 26, wherein said common perspective is calculated from an average of said at least one clustering parameter.
- 28. (currently amended) The computer readable medium of Claim <u>25</u> 26, wherein said method further comprises:

generating a three-dimensional model of said object to which said new view synthesis technique is applied to generate said common video image stream.

- 29. (Original) The computer readable medium of Claim 25, wherein data streams associated with said cluster of receiving nodes are substantially similar.
- 30. (Original) The computer readable medium of Claim 25, wherein said sending said common data stream in said method further comprises:

multicasting said common data stream from said sending node over a communication network to said cluster of receiving nodes to achieve communication network traffic efficiency.

31. (Original) The computer readable medium of Claim 25, wherein said at least one clustering parameter comprises a view dependent clustering parameter that defines an associated perspective of a receiving node within said virtual environment, wherein each of said cluster of

Serial No.: 10/684,033 6 Examiner: Frantz B., Jean
Art Unit: 2154

receiving nodes is spatially located in said virtual environment, such that their respective

perspectives are similar resulting in said clustering parameter that is shared.

32. (Original) The computer readable medium of Claim 25, wherein said at least one

clustering parameter comprises a temporal clustering parameter, wherein each of said cluster of

receiving nodes require substantially the same frame rate, such that their respective data quality

requirements are similar.

33. (Original) The computer readable medium of Claim 25, wherein said at least one

clustering parameter comprises a spatial clustering parameter, wherein each of said cluster of

receiving nodes require substantially the same resolution, such that their respective data

resolution requirements are similar.

34. (Original) The computer readable medium of Claim 33, wherein said method further

comprises:

limiting resolution of said common data stream based on resolution capabilities of display

devices associated with said cluster of receiving nodes.

35. (Original) The computer readable medium of Claim 33, wherein said method further

comprises:

increasing a resolution parameter value of a receiving node as said sending node becomes

more important to said receiving node in said virtual environment; and

decreasing said resolution parameter value as said sending node becomes less important

to said receiving node in said virtual environment.

36. (Original) The computer readable medium of Claim 35, wherein said method further

comprises:

valuing an importance of said sending node based on whether a receiving node is gazing

at a representation of said sending node in said virtual environment.

37. (Original) The computer readable medium of Claim 35, wherein said method further comprises:

valuing an importance of said sending node based on how close to a center of a monitoring device associated with said receiving node is a representation of said sending node displayed.

38. (Original) The computer readable medium of Claim 35, wherein said method further comprises:

valuing an importance of said sending node based on whether said sending node is speaking.

39. (Original) The computer readable medium of Claim 25, wherein said determining a cluster of receiving nodes in said method further comprises:

dynamically changing said test for determining said cluster of receiving nodes in said virtual environment in response to changing conditions for computational resources in a communication network supporting said virtual environment and said cluster of receiving nodes.

40. (cancelled)
